2-1- Exponential and Logarithm functions :

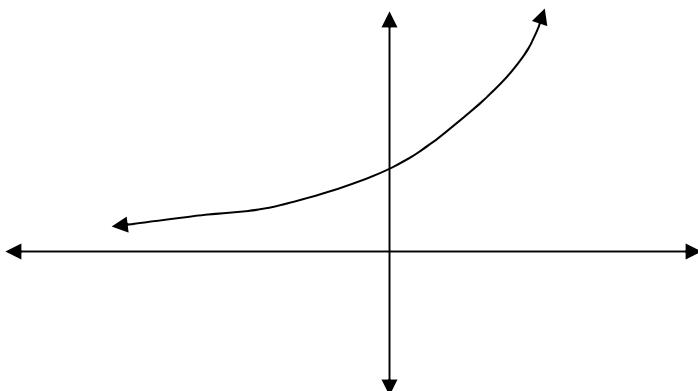

Exponential functions : If a is a positive number and x is any number , we define the exponential function as :

$$y = a^x \quad \text{with domain : } -\infty < x < \infty \\ \text{Range : } y > 0$$

The properties of the exponential functions are :

1. If $a > 0 \leftrightarrow a^x > 0$.
2. $a^x \cdot a^y = a^{x+y}$.
3. $a^x / a^y = a^{x-y}$.
4. $(a^x)^y = a^{xy}$.
5. $(a \cdot b)^x = a^x \cdot b^x$.
6. $a^{\frac{x}{y}} = \sqrt[y]{a^x} = (\sqrt[y]{a})^x$.
7. $a^{-x} = 1/a^x$ and $a^x = 1/a^{-x}$.
8. $a^x = a^y \leftrightarrow x = y$.
9. $a^0 = 1$,
 $a^\infty = \infty$, $a^{-\infty} = 0$, where $a > 1$.
 $a^\infty = 0$, $a^{-\infty} = \infty$, where $a < 1$.

The graph of the exponential function $y = a^x$ is :

Logarithm function : If a is any positive number other than 1 , then the logarithm of x to the base a denoted by :

$$y = \log_a x \quad \text{where } x > 0$$

At $a = e = 2.7182828\dots$, we get the natural logarithm and denoted by :

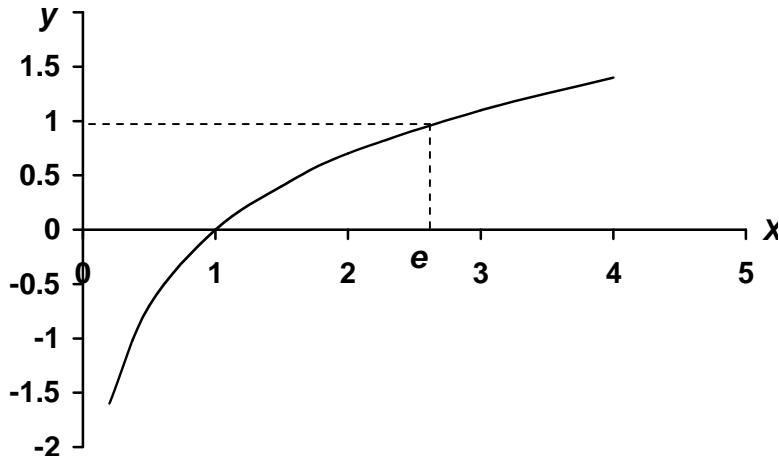

$$y = \ln x$$

Let $x, y > 0$ then the properties of logarithm functions are :

1. $y = a^x \leftrightarrow x = \log_a y$ and $y = e^x \leftrightarrow x = \ln y$.
2. $\log_e x = \ln x$.
3. $\log_a x = \ln x / \ln a$.

4. $\ln(x \cdot y) = \ln x + \ln y$.
5. $\ln(x / y) = \ln x - \ln y$.
6. $\ln x^n = n \cdot \ln x$.
7. $\ln e = \log_a a = 1$ and $\ln 1 = \log_a 1 = 0$.
8. $a^x = e^{x \cdot \ln a}$.
9. $e^{\ln x} = x$.

The graph of the function $y = \ln x$ is :

Application of exponential and logarithm functions :

We take Newton's law of cooling :

$$T - T_S = (T_0 - T_S) e^{-kt}$$

where T is the temperature of the object at time t .

T_S is the surrounding temperature .

T_0 is the initial temperature of the object .

k is a constant .

EX-1- The temperature of an ingot of metal is 80°C and the room temperature is 20°C . After twenty minutes, it was 70°C .

- a) What is the temperature will the metal be after 30 minutes?
- b) What is the temperature will the metal be after two hours?
- c) When will the metal be 30°C ?

Sol. :

$$T - T_S = (T_0 - T_S) e^{-kt} \Rightarrow 50 = 60 e^{-20k} \Rightarrow k = \frac{\ln 5 - \ln 6}{20} = -0.0091$$

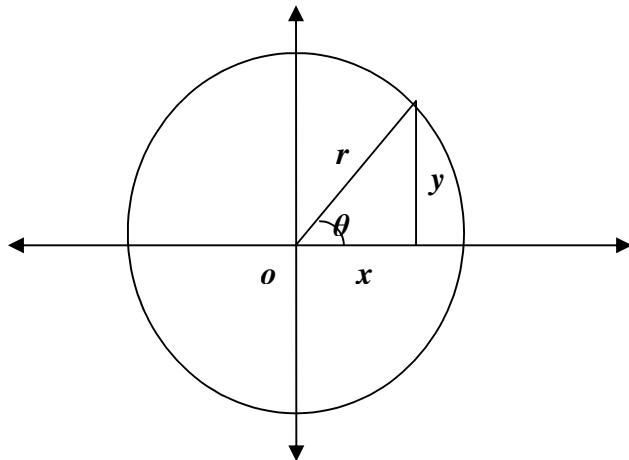

$$a) T - 20 = 60 e^{30(-0.0091)} = 60 * 0.761 = 45.6^{\circ}\text{C} \Rightarrow T = 65.6^{\circ}\text{C}$$

$$b) T - T_S = 60 e^{120(-0.0091)} = 60 * 0.335 = 20.1^{\circ}\text{C} \Rightarrow T = 40.1^{\circ}\text{C}$$

$$c) 10 = 60 e^{-0.0091 t} \Rightarrow -0.0091 t = -\ln 6 \Rightarrow t = 3.3 \text{ hrs.}$$

2-2- Trigonometric functions : When an angle of measure θ is placed in standard position at the center of a circle of radius r , the trigonometric functions of θ are defined by the equations :

$$\sin \theta = \frac{y}{r} = \frac{1}{\csc \theta}, \quad \cos \theta = \frac{x}{r} = \frac{1}{\sec \theta}, \quad \tan \theta = \frac{y}{x} = \frac{1}{\cot \theta} = \frac{\sin \theta}{\cos \theta}$$

The following are some properties of these functions :

- 7) $\cos^2 \theta = \frac{1 + \cos 2\theta}{2} \quad \text{and} \quad \sin^2 \theta = \frac{1 - \cos 2\theta}{2}$
- 8) $\sin(\theta \mp \frac{\pi}{2}) = \mp \cos \theta \quad \text{and} \quad \cos(\theta \mp \frac{\pi}{2}) = \pm \sin \theta$
- 9) $\sin(-\theta) = -\sin \theta \quad \text{and} \quad \cos(-\theta) = \cos \theta \quad \text{and} \quad \tan(-\theta) = -\tan \theta$
- 10) $\sin \theta \sin \beta = \frac{1}{2} [\cos(\theta - \beta) - \cos(\theta + \beta)]$
 $\cos \theta \cos \beta = \frac{1}{2} [\cos(\theta - \beta) + \cos(\theta + \beta)]$
 $\sin \theta \cos \beta = \frac{1}{2} [\sin(\theta - \beta) + \sin(\theta + \beta)]$

$$11) \quad \sin \theta + \sin \beta = 2 \sin \frac{\theta + \beta}{2} \cdot \cos \frac{\theta - \beta}{2}$$

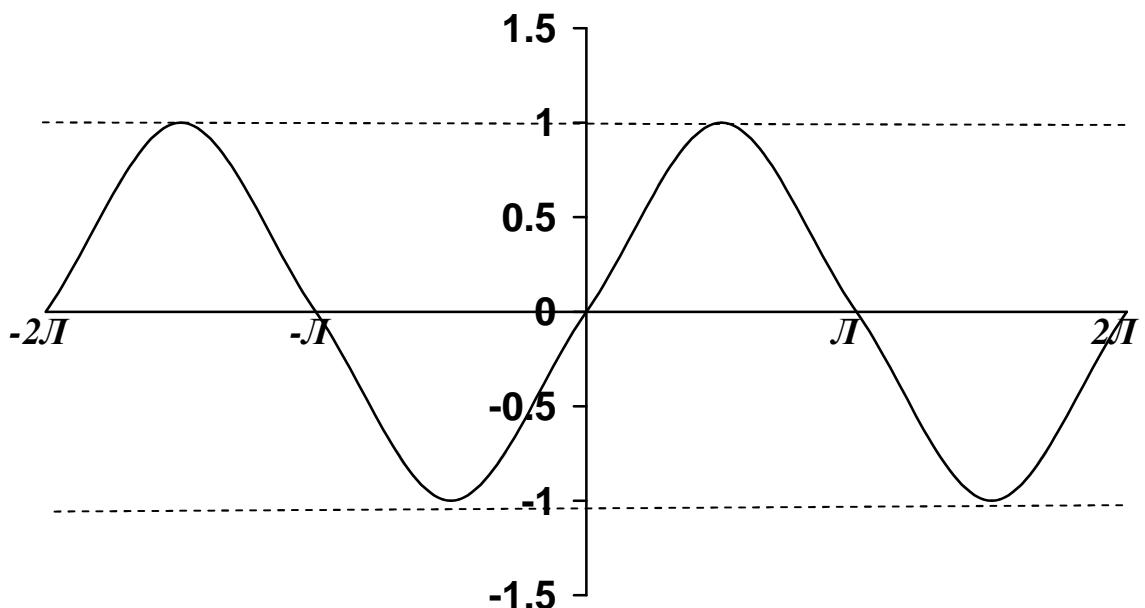

$$\sin \theta - \sin \beta = 2 \cos \frac{\theta + \beta}{2} \cdot \sin \frac{\theta - \beta}{2}$$

$$12) \quad \cos \theta + \cos \beta = 2 \cos \frac{\theta + \beta}{2} \cdot \cos \frac{\theta - \beta}{2}$$

$$\cos \theta - \cos \beta = -2 \sin \frac{\theta + \beta}{2} \cdot \sin \frac{\theta - \beta}{2}$$
